Higher Level C++
with
The Boost Libraries

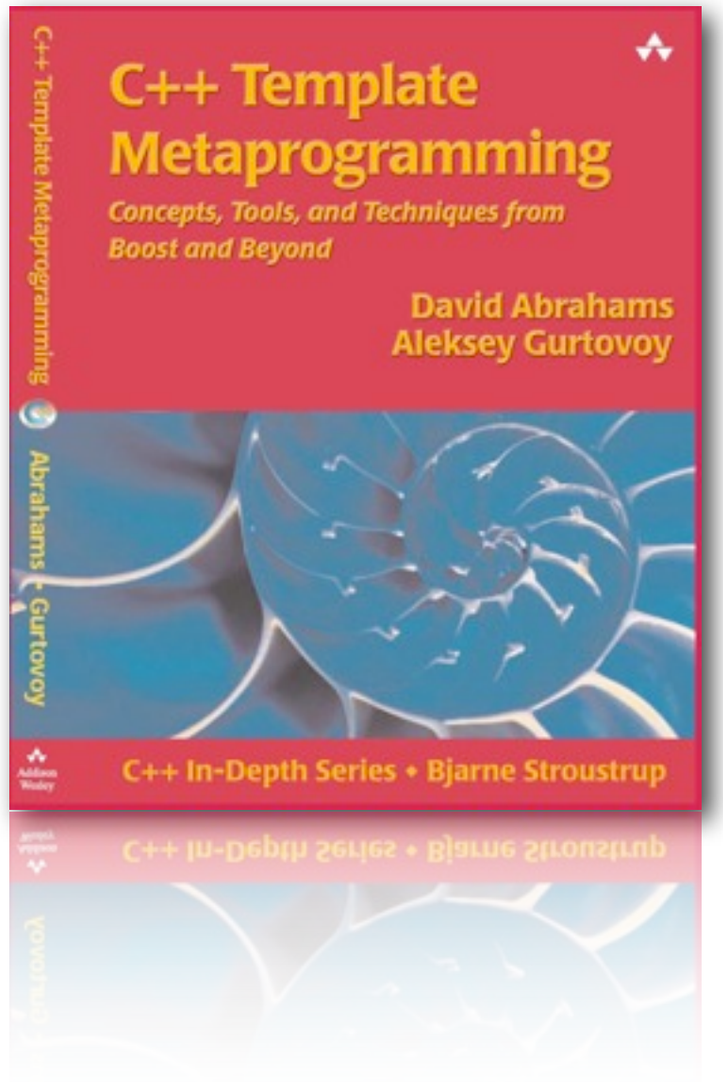
http://github.com/boostpro/bbn-2012-11

boostpro computing

Dave Abrahams

(me)

- C++ Committee member since 1996
- Founding member, Boost.org
- Founder, BoostPro Computing
- Trainer, consultant, software developer
- Author



boostpro computing

My World ca. 1995

- Page Layout
- Printing
- GUI Design
- Asynchronous I/O (MIDI)
- AI for Transcription
- Portability

boostpro computing

Infrastructure Requirements

- GUI framework
- Document Framework (undo/serialization)
- Dynamic Arrays
- Algorithms, e.g. Sort, Binary Search
- Fast Dynamic Memory
- Error Handling

Build It Yourself

- Evolves by accretion, not by design
- Limited in capability
- One-offs: not interoperable
- Undocumented
- Not speed-tested
- Buggy (it turns out)

boostpro computing

The Bottom Line

A professional programmer has a lot on his/her mind!

boostpro computing

Enter: STL

- Reliable containers and algorithms
- Documented requirements/guarantees
- Choice of capability/performance tradeoffs
- Interoperability with low coupling
- Standardization ➔ lingua franca
- Programming Paradigm ➔ less thinking!

boostpro computing

Background:

Effective programmers focus on solving problems in their application's domain, not on writing reliable, efficient, general-purpose building blocks.

boostpro computing

But Enough About Me...

- Why are you here?
- What libraries are you using?
- What kinds of things do you work on?

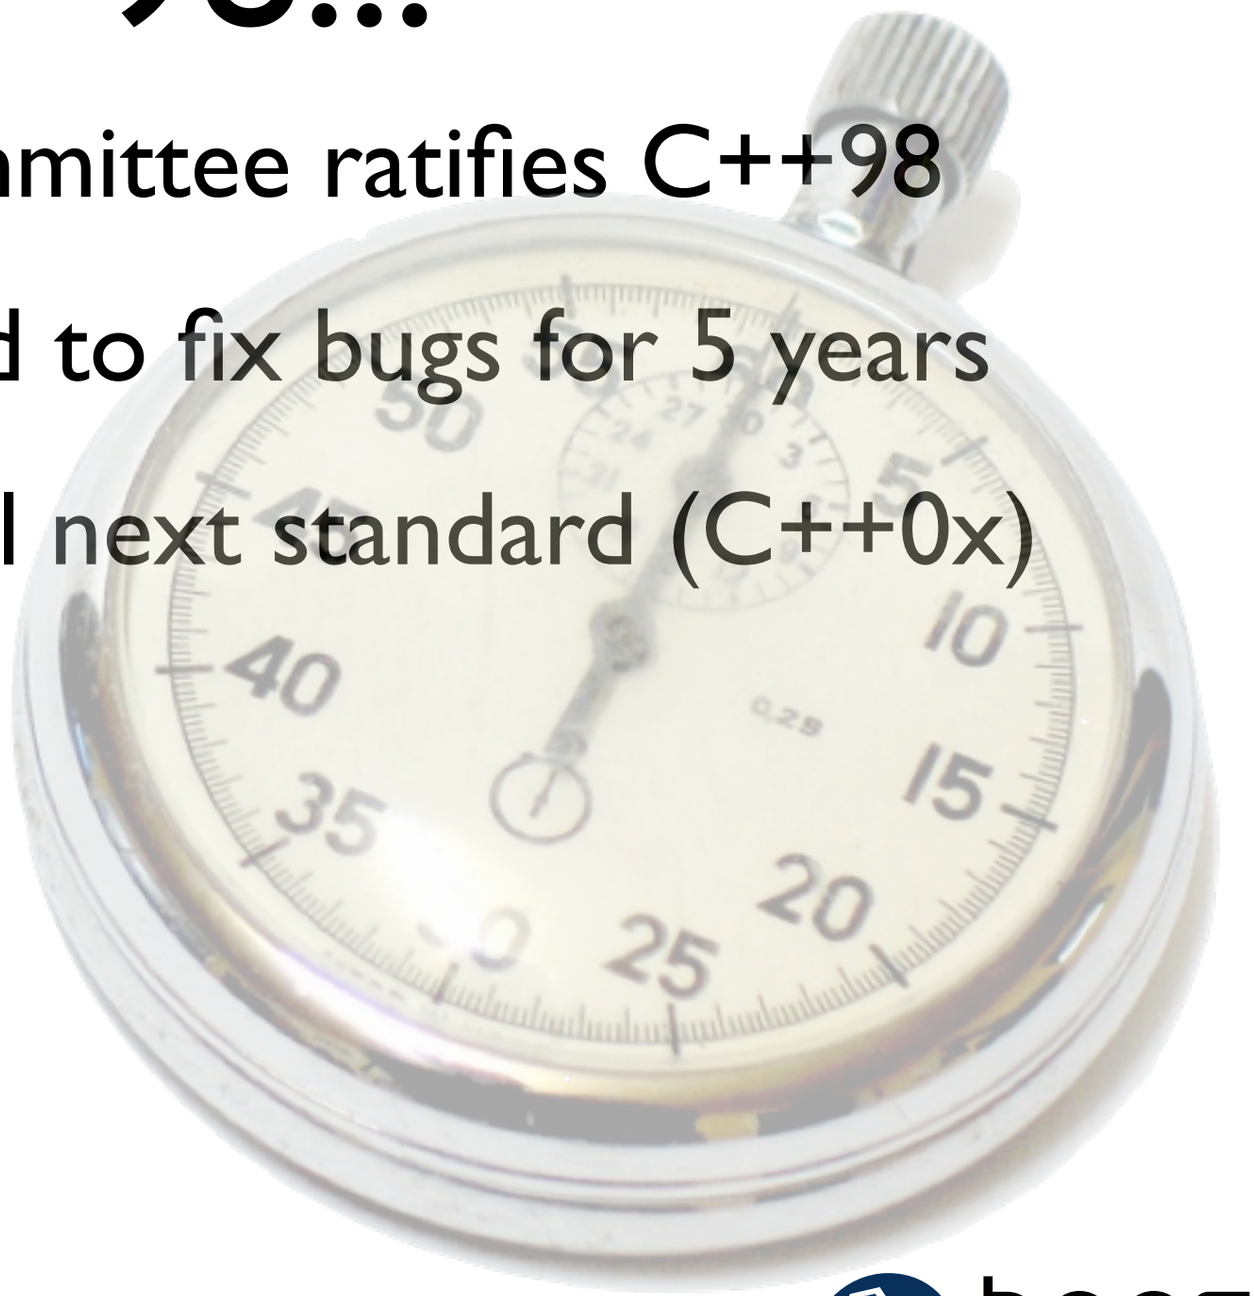
We *Need* High-Level Libraries

- Less code ⇒ Real productivity
  - Less to write
  - Less to debug
- More expressive code
  - Natural to write
  - More self-documenting
  - More likely to be correct the first time

boostpro computing

It All Started Back In '98...

- Standards committee ratifies C++98
- Only supposed to fix bugs for 5 years
- 10+ years until next standard (C++0x)



boostpro computing

It All Started Back In '98...

- Standards committee ratifies C++98
- Only supposed to fix bugs for 5 years
- 10+ years until next standard (C++0x)

Beman Dawes

boostpro computing

It All Started Back In '98...

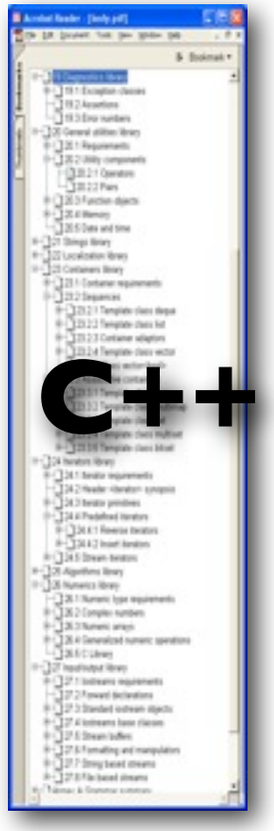
- Standards committee ratifies C++98
- Only supposed to fix bugs for 5 years
- 10+ years until next standard (C++0x)

- How will get the C++0x std:: libraries?
- Will they be based on "existing practice?"

Beman Dawes

boostpro computing

Standard Library
DEATHMATCH

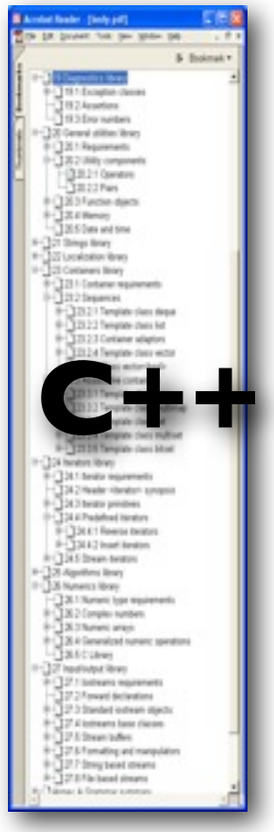


boostpro computing

Standard Library
DEATHMATCH

Python

Java



C++

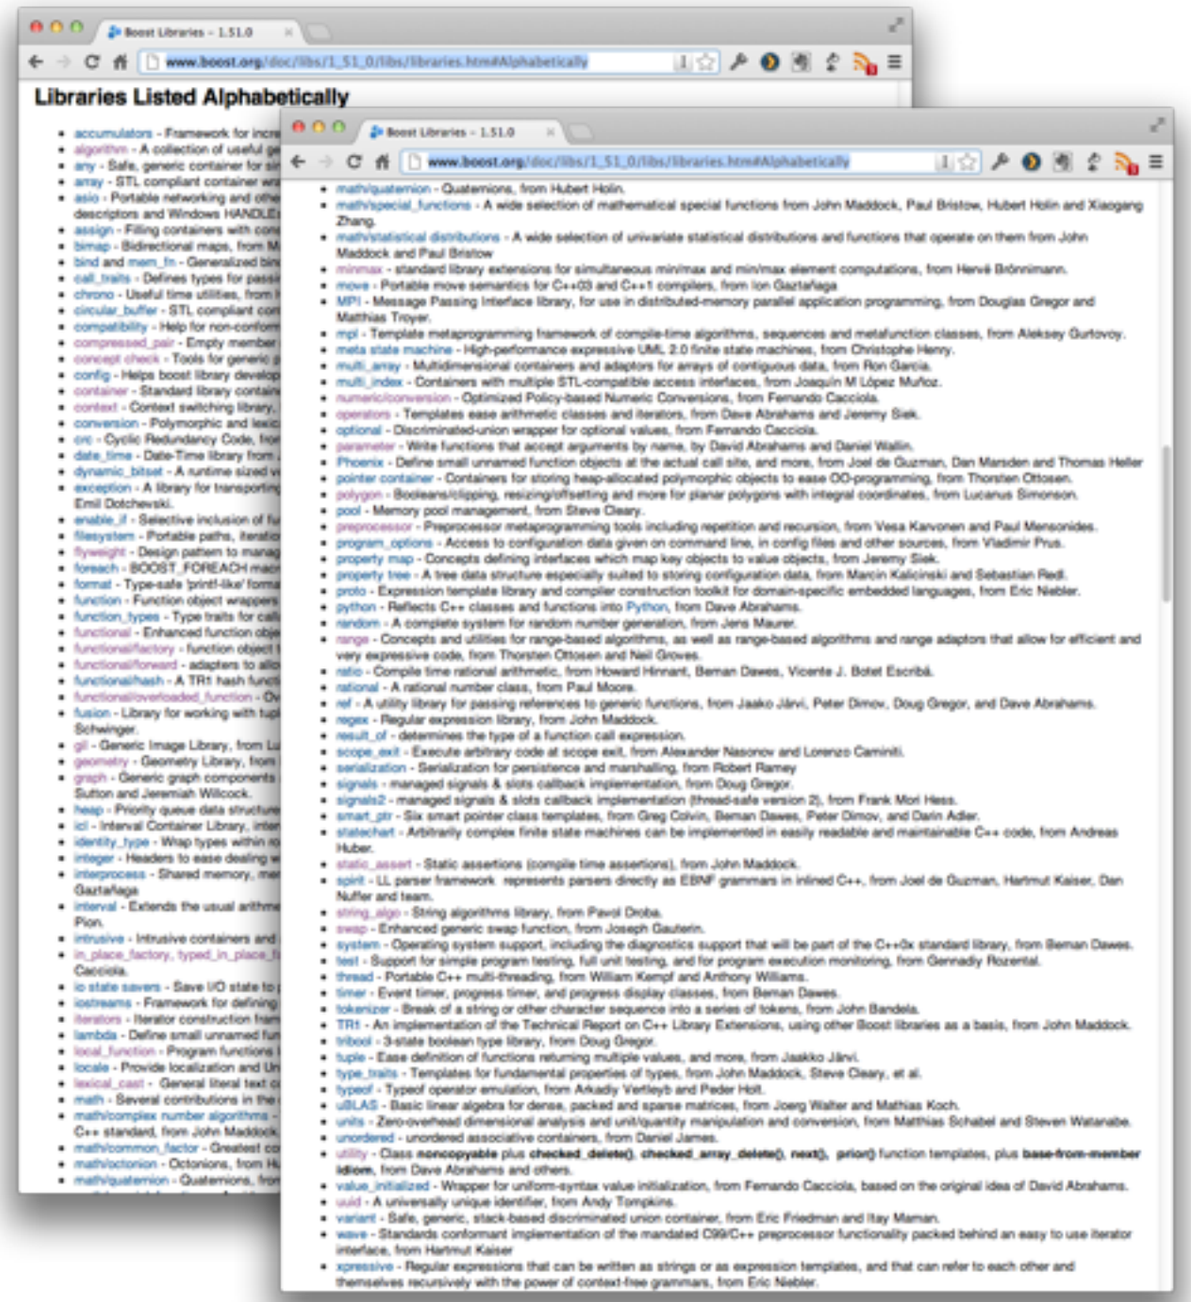
CPAN

Perl

boostpro computing

- To Encourage Adoption ("Practice"):
  - Open Source
  - Peer Reviewed
  - Licensed Non-Virally
- Suitable for Standardization
  - Portable
  - Well Documented

Where Are the Libraries?



Boost:
117 libraries
and growing!
(10 in C++11)

boostpro computing

What's In Boost: Domains

- Text Processing / Parsing
- Data Structures
- Iterators
- Algorithms
- Function Objects
- Generic Programming Utilities
- Concurrency
- Metaprogramming / Code Generation
- Numerics
- Correctness / Testing
- Input / Output
- Language Binding
- Memory Management
- Programming Interfaces
- …etc.

Who's Using Boost

- Adobe
- Microsoft
- RealNetworks
- CERN (Large Hadron Collider)
- SAP NetWeaver
- National Labs (LLNL, LBL, Sandia)
- …etc.

boostpro computing

FOSS Using Boost (Mac)

```
$ grep -r -l port:boost . | sed -e 's#\./.*/\(.*\)/Portfile#\1#g'
```

boostpro computing

FOSS Using Boost (Mac)

```
$ grep -r -l port:boost . | sed -e 's#\./.*/\(.*\)/Portfile#\1#g'
```

boostpro computing

Why Boost Matters

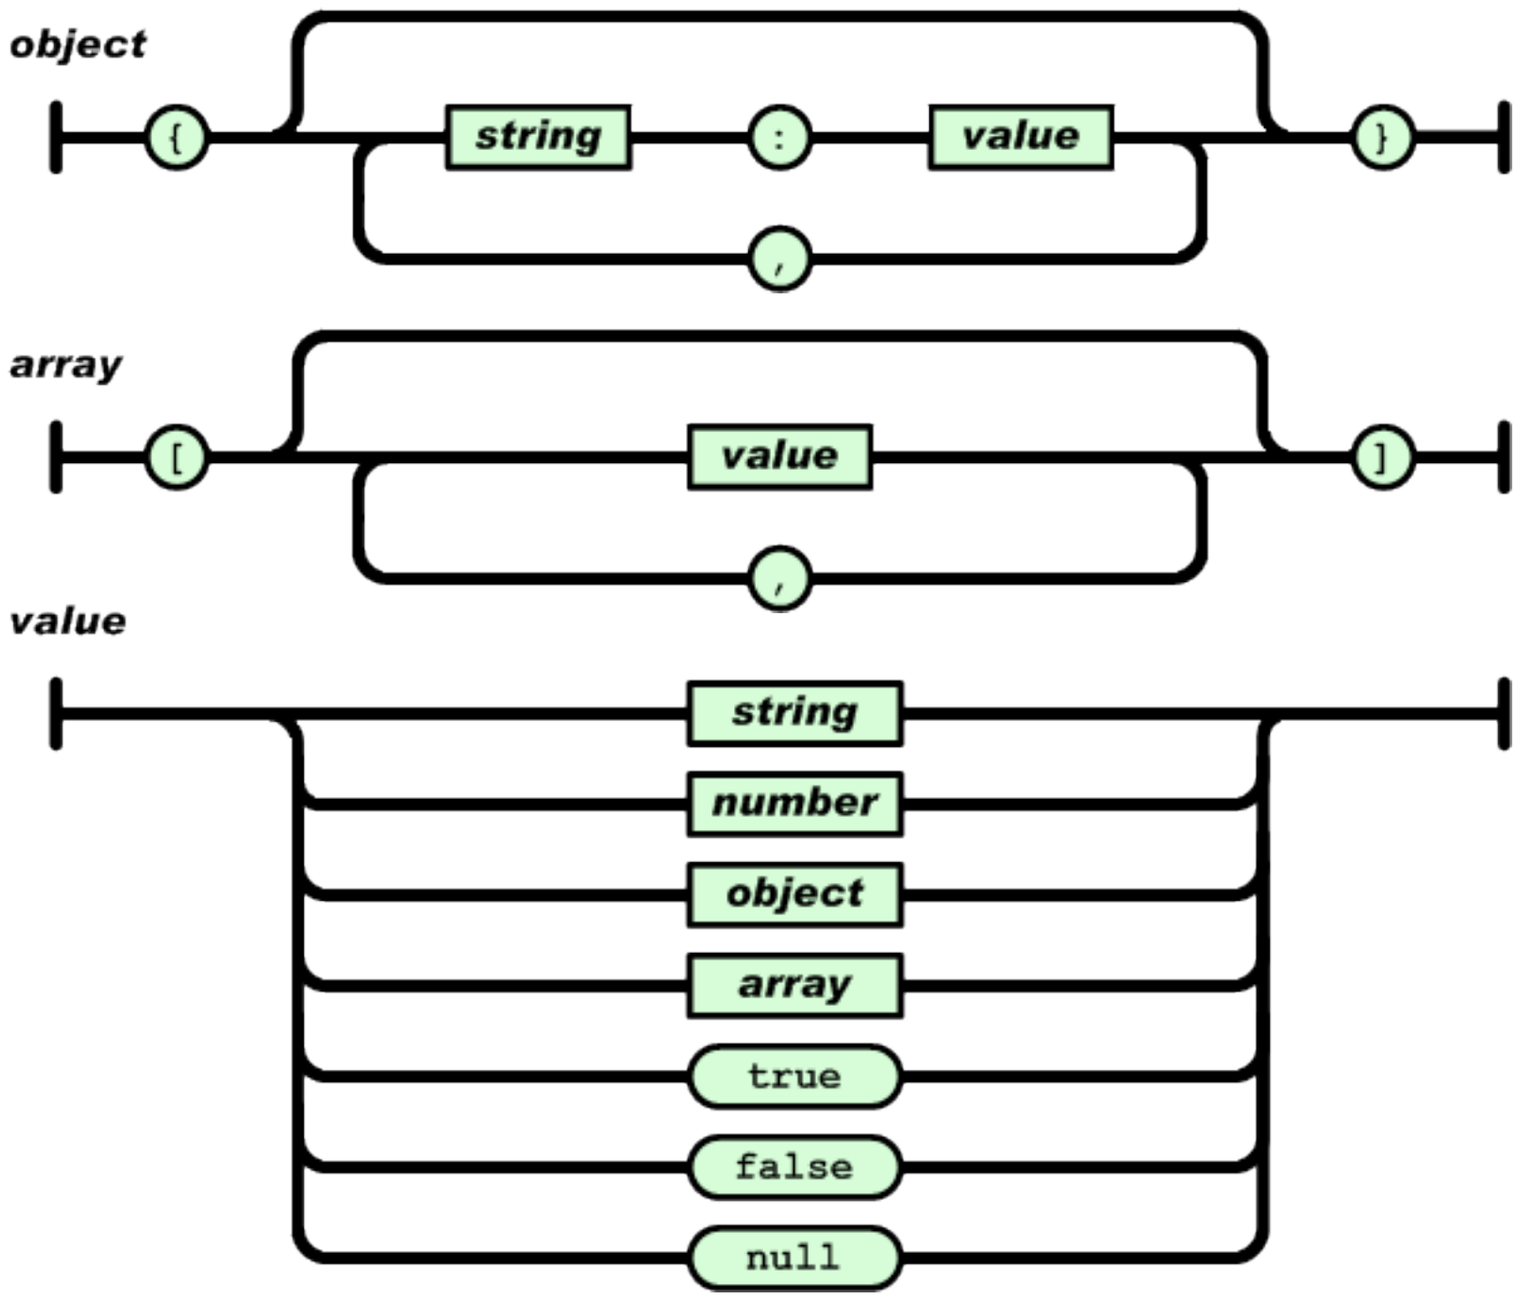
- Free high-level libraries
- Cutting-edge C++ practiced here!
  - Idioms & abstractions
  - Techniques
  - Best practices
- High quality
- Major contributor to C++ standard
- Widely used in major commercial software

The Boost Core

Basics, Touchstones and Idioms

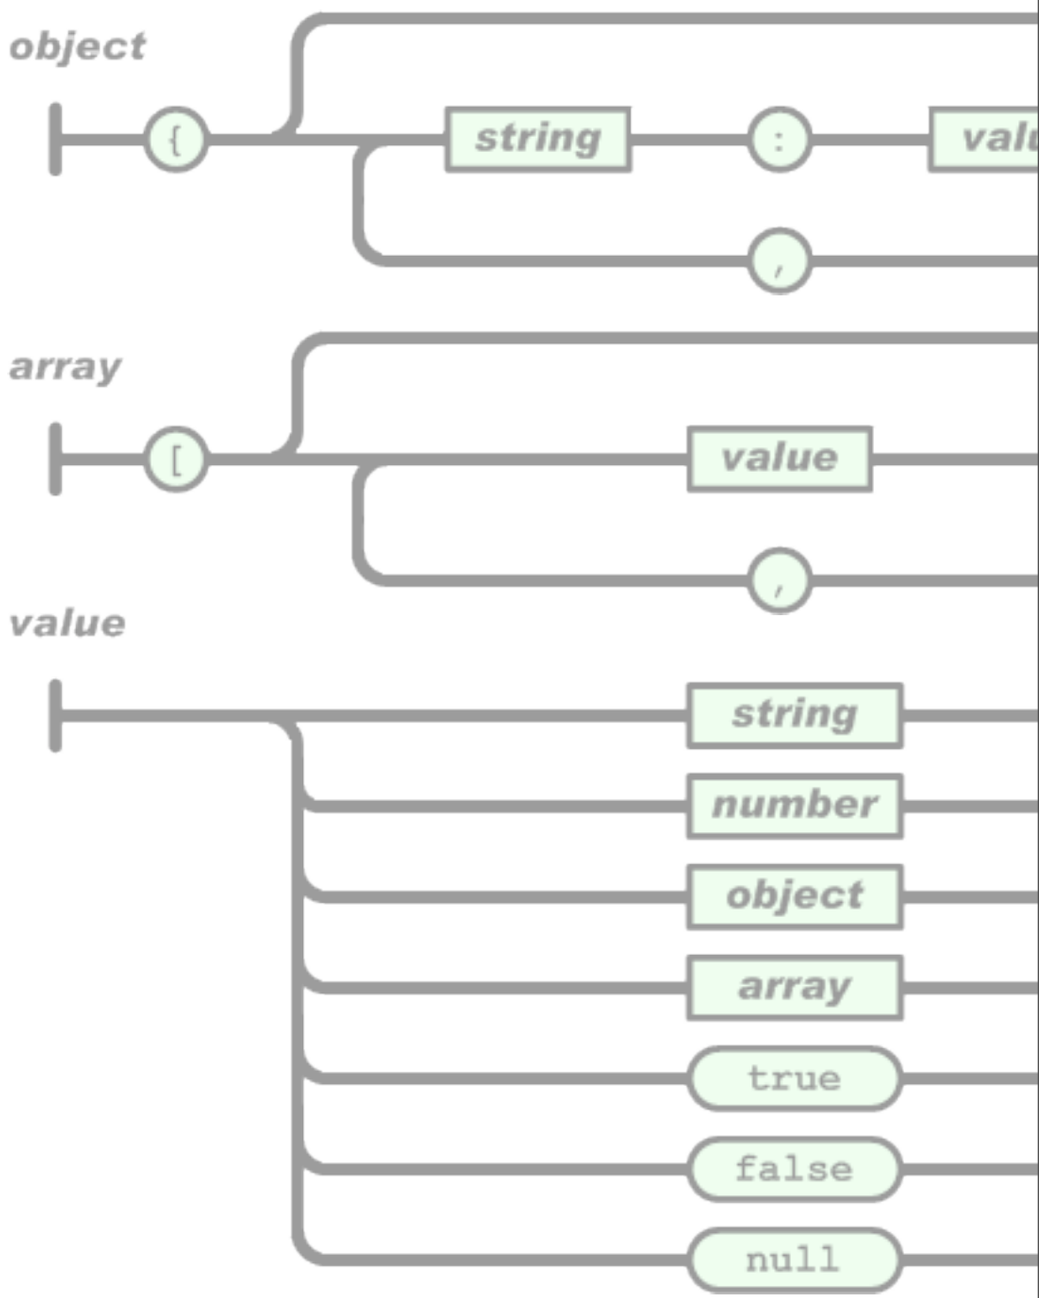
boostpro computing

JSON



boostpro computing

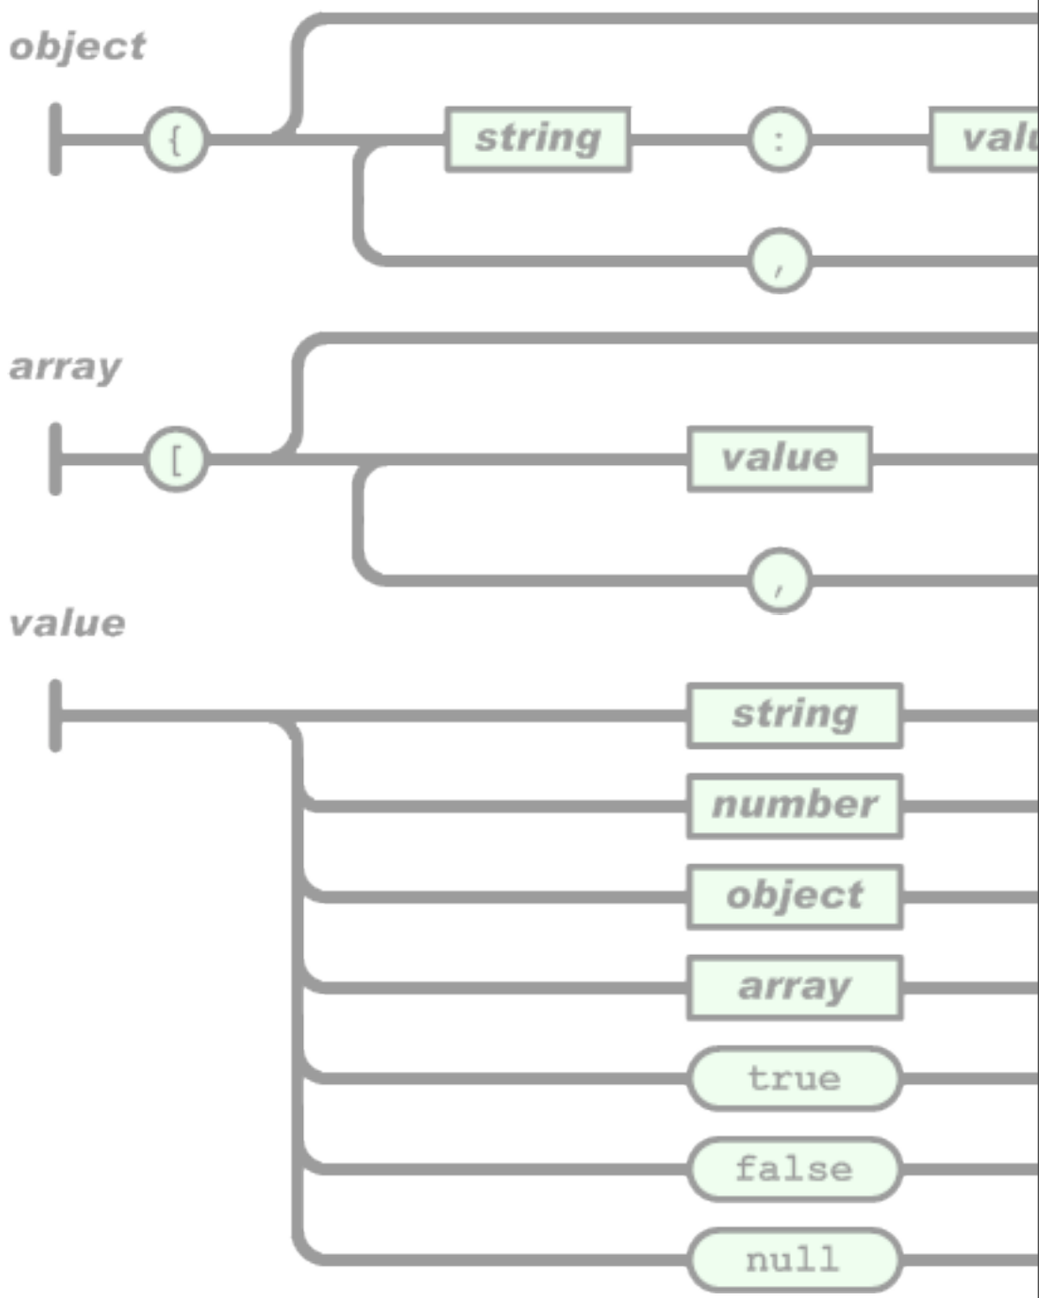
JSON



boostpro computing

JSON

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
        "Jamming",
        "Biking",
        "Hacking"
    ]
}
```



boostpro computing

Representation

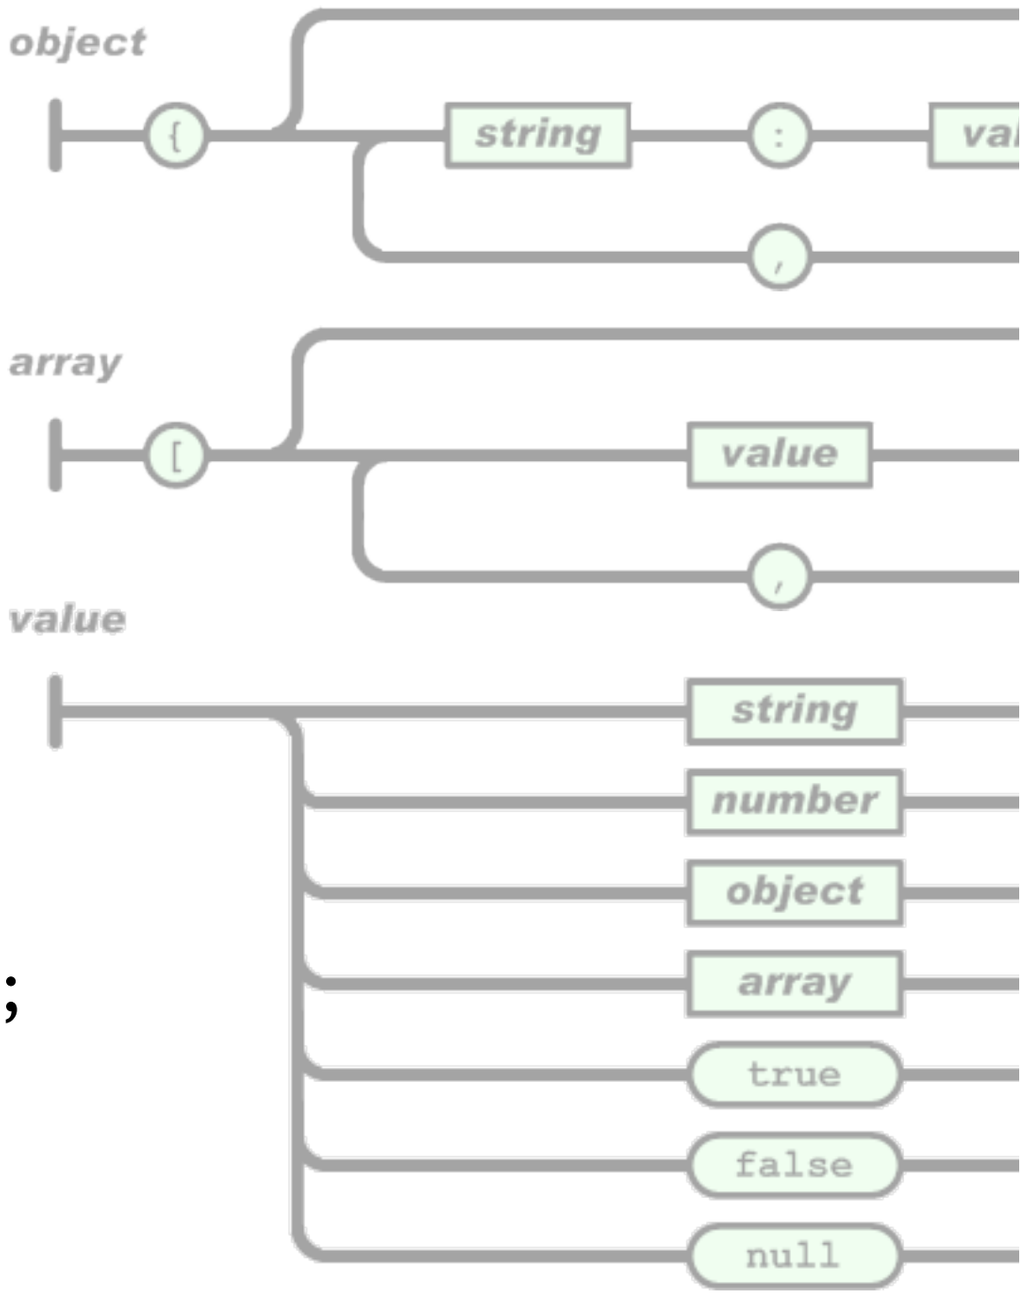
```
namespace json {

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;

}
```



boostpro computing

Representation

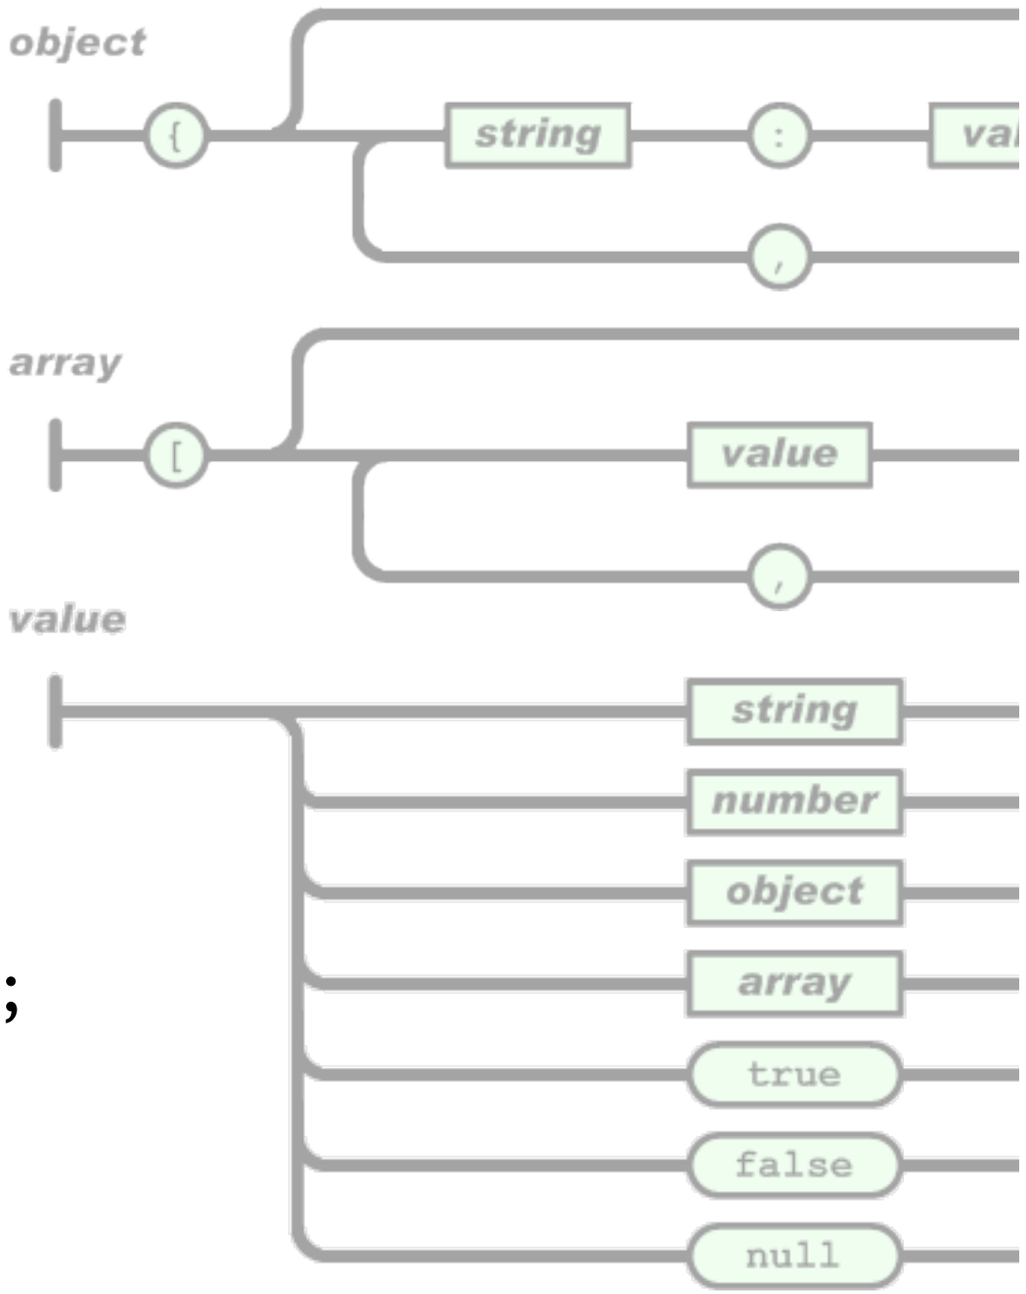
```
namespace json {

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;

}
```



boostpro computing

Representation

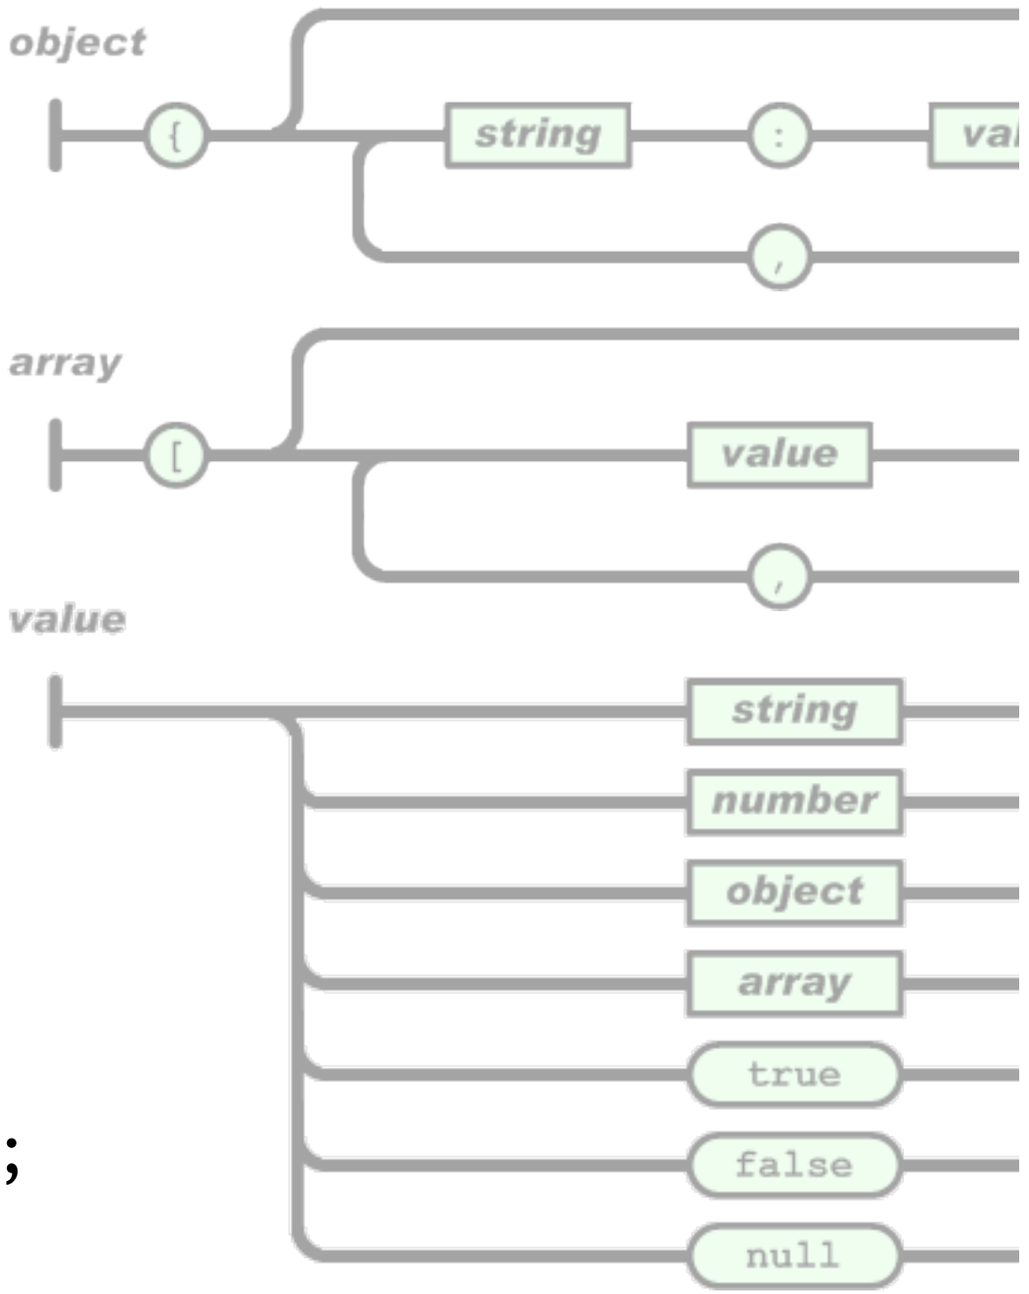
```
namespace json {

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;

}
```



boostpro computing

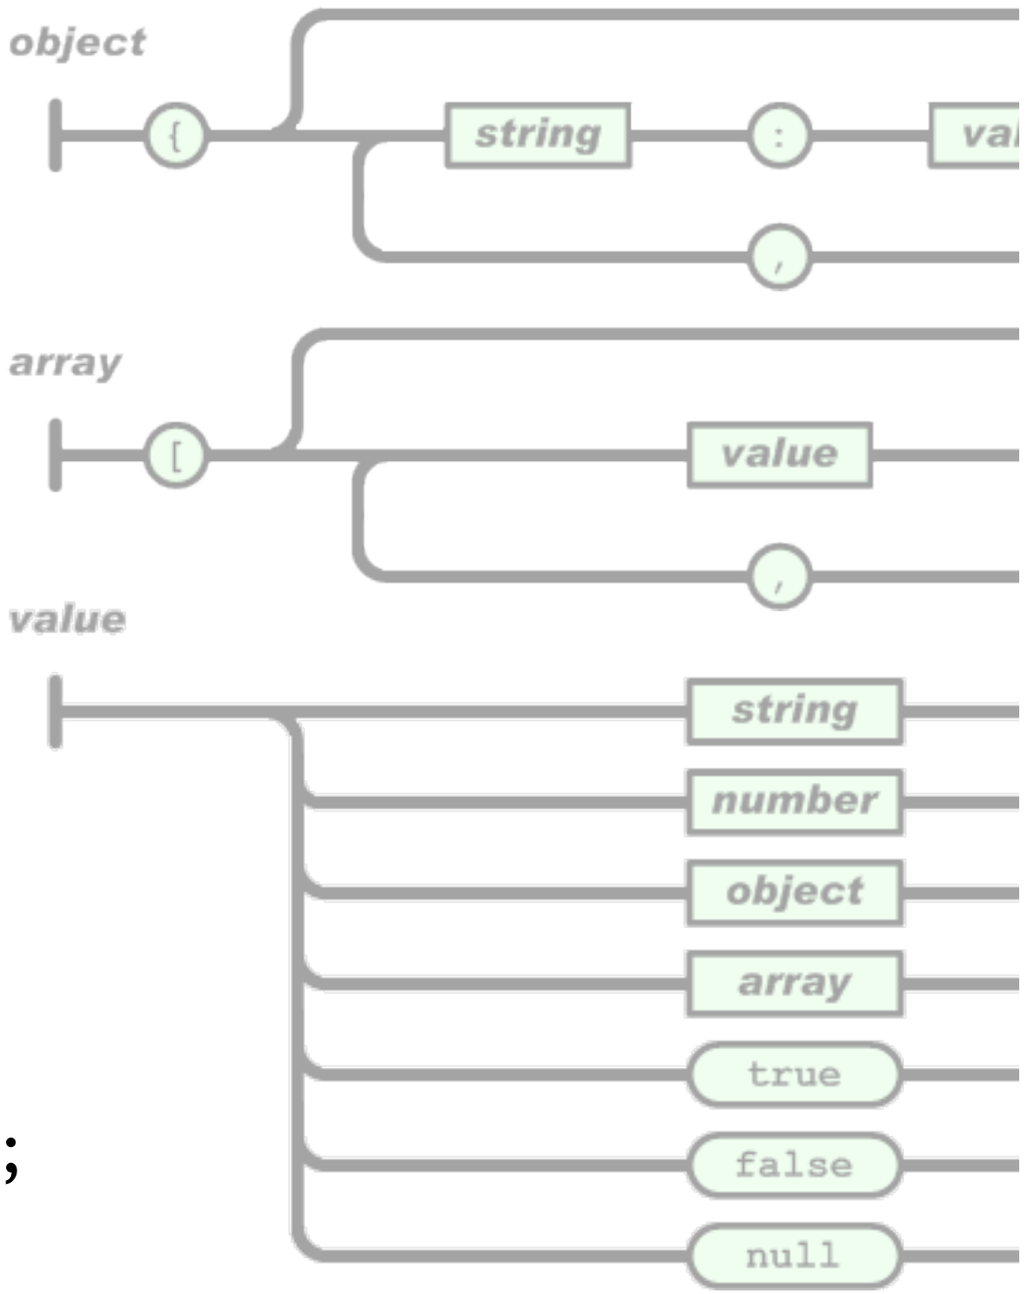
Representation

```
namespace json {

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;
}
```



boostpro computing

Representation

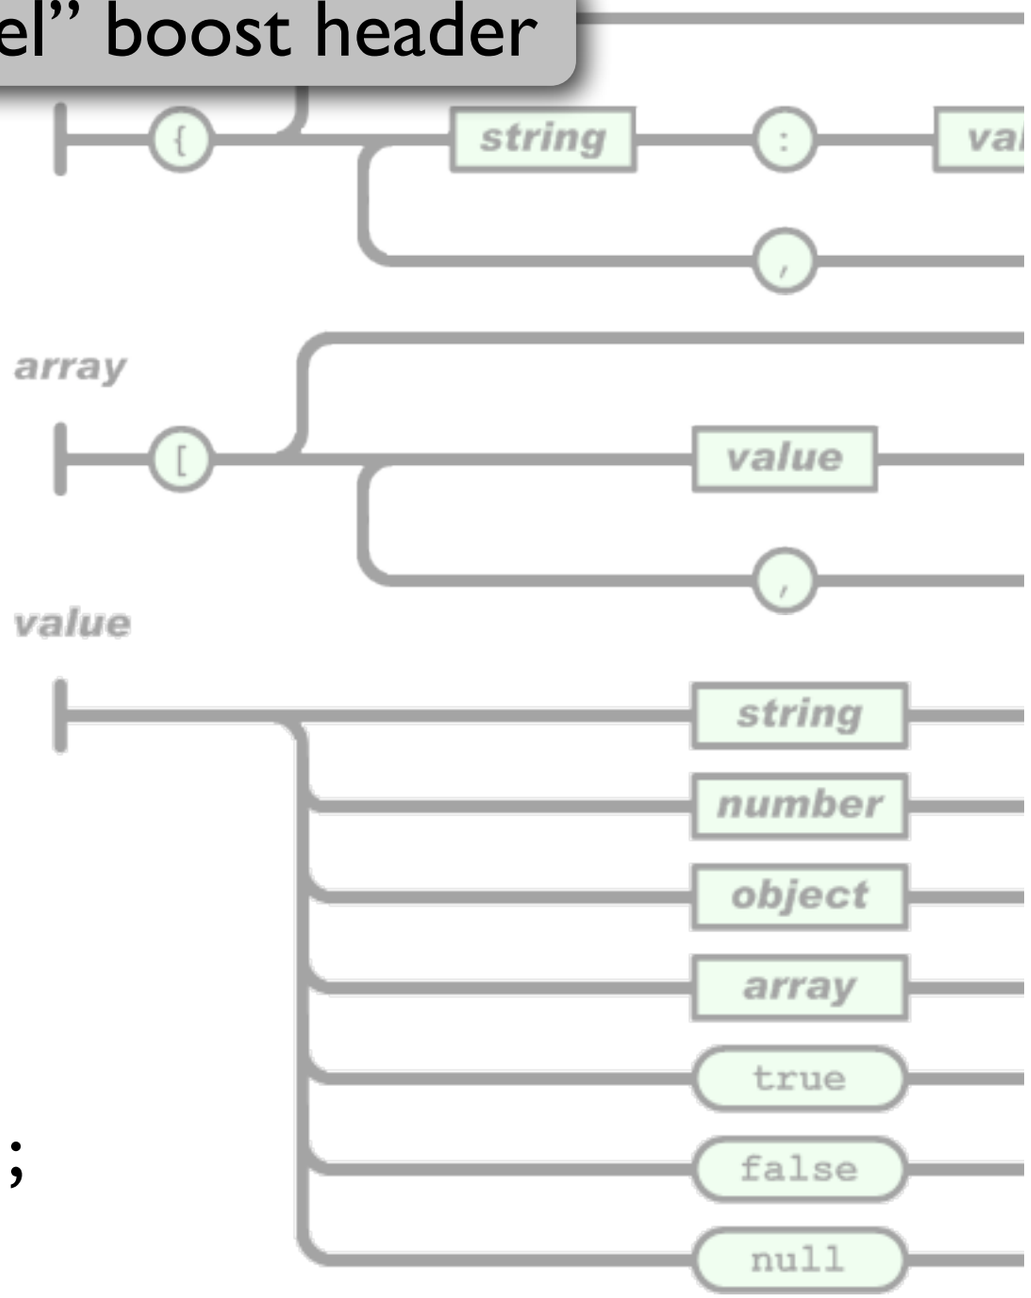
"Top-level" boost header

```
#include <boost/any.hpp>
namespace json {

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;
}
```



boostpro computing

Representation

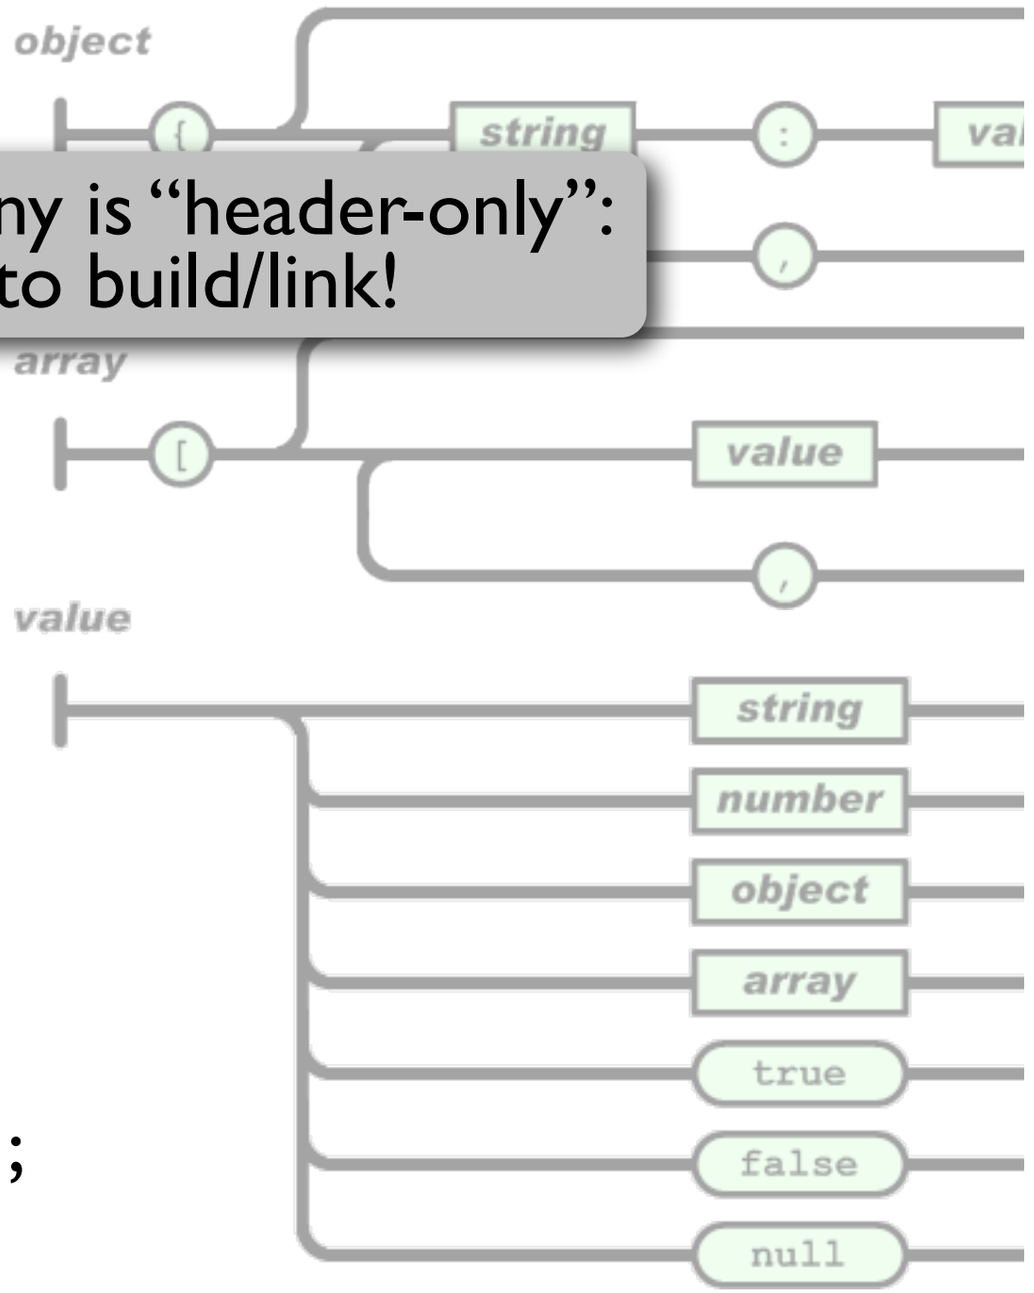
```
#include <boost/any.hpp>
namespace json {

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;
}
```

Boost.Any is “header-only”: nothing to build/link!



boostpro computing

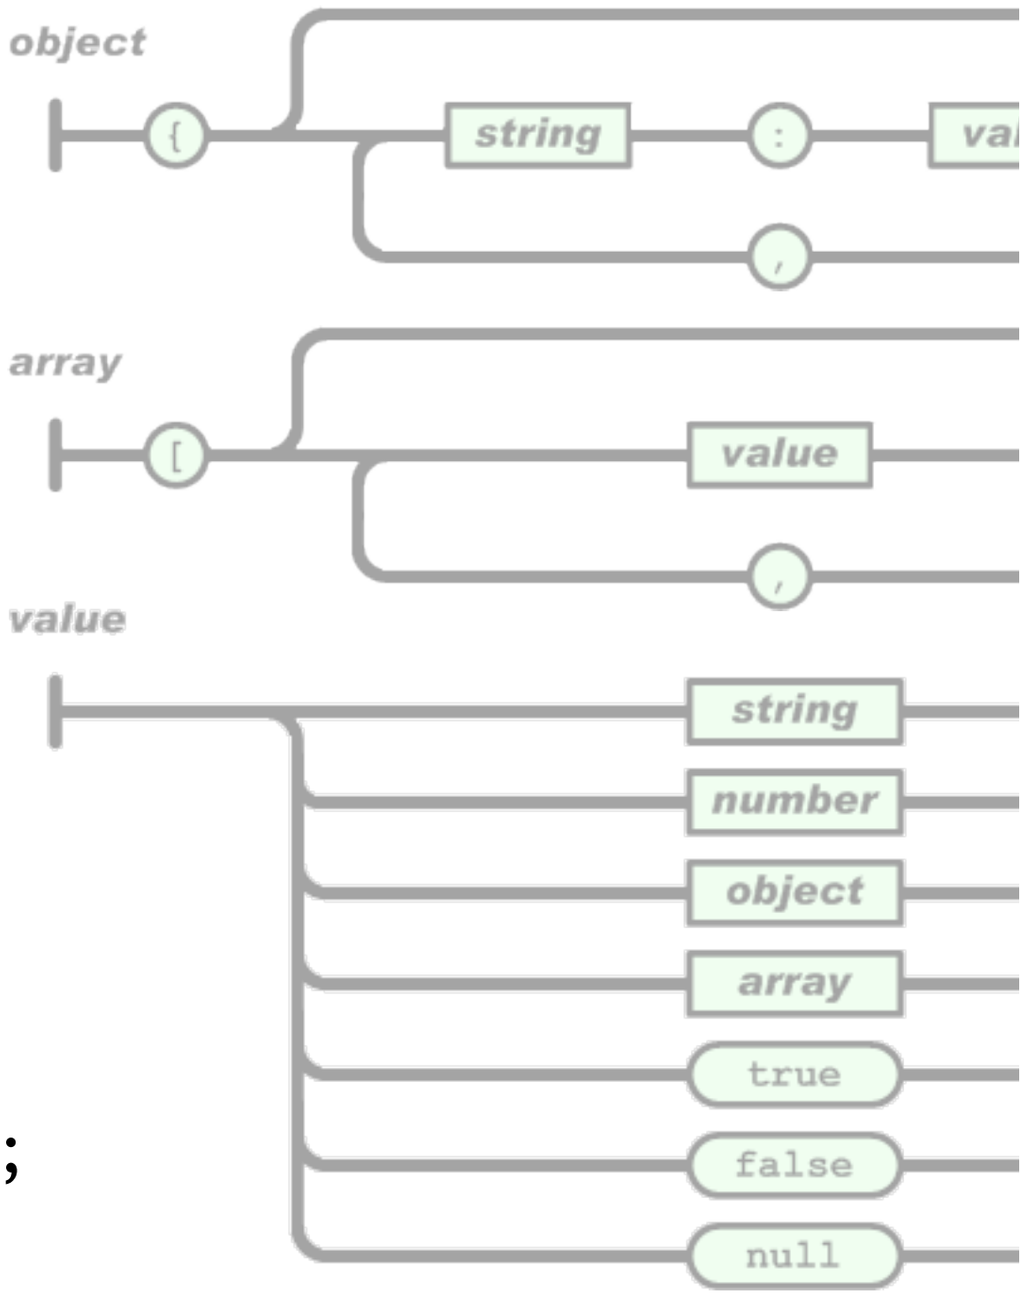
Representation

```
#include <boost/any.hpp>
namespace json {

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;
}
```



boostpro computing

Representation

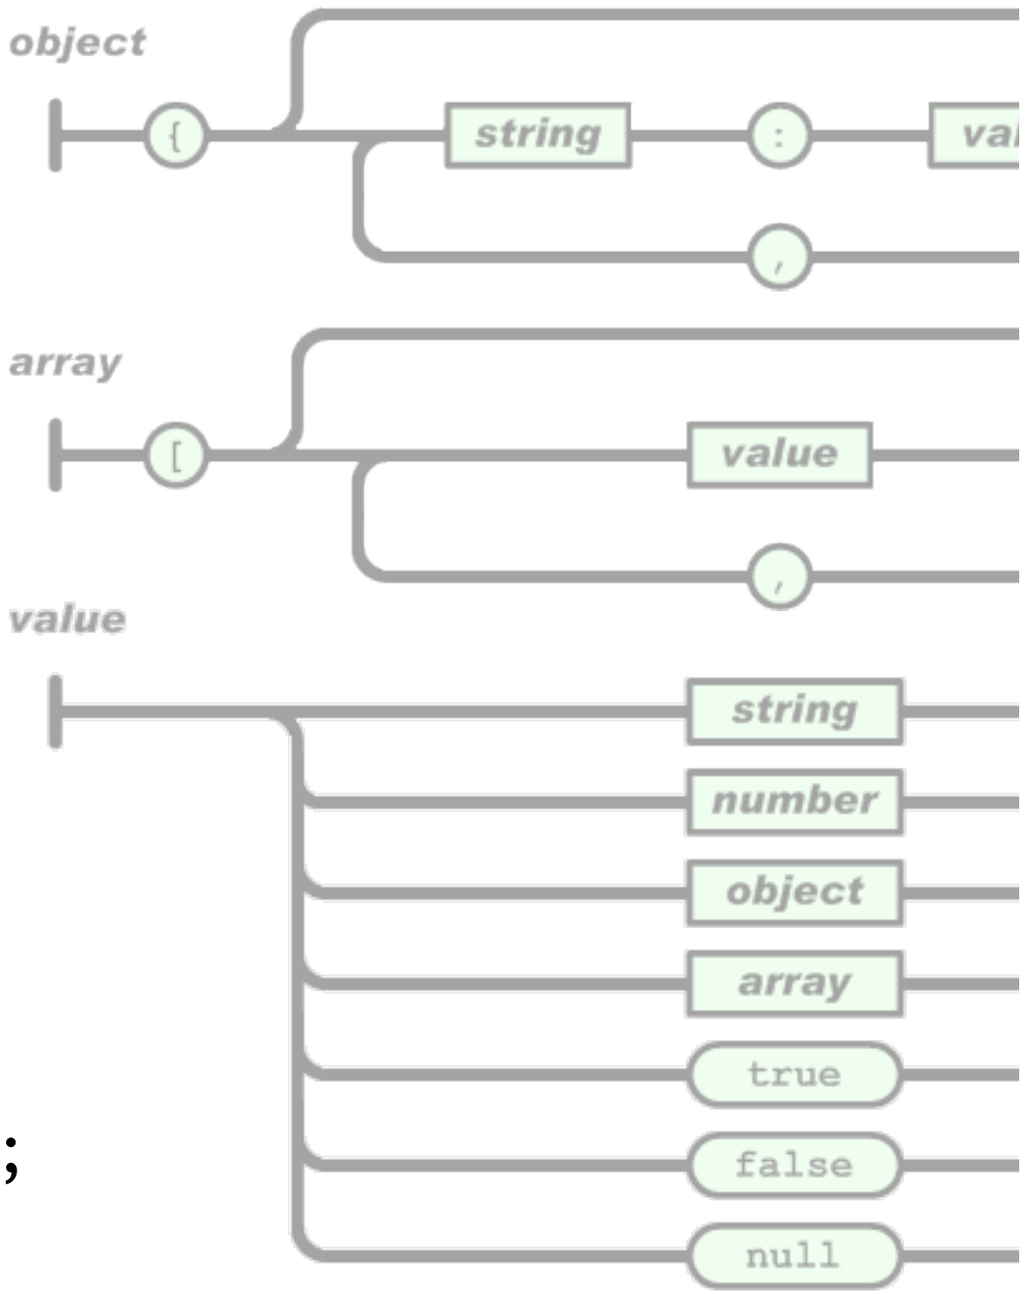
```
#include <boost/any.hpp>
namespace json {

typedef boost::any value;

typedef
  std::map<std::string, value>
object;

typedef std::vector<value> array;

typedef std::string          string;
typedef long double          number;
typedef bool                 boolean;
typedef struct null {}       null;
}
```



Store Any Value…

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

x stores an int: 3

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

y stores a float

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

z stores a vector

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

now z stores 3

boostpro computing

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

boostpro computing

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

Error; can't copy
`char const[14]`

boostpro computing

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = "Hello, World!"
}
```

boostpro computing

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = std::string("Hello, World!");
}
```

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = std::string("Hello, World!");
}
```

OK: `std::string` is a value type

boostpro computing

Store Any Value…

```
#include <boost/any.hpp>
#include <vector>
#include <string>

int main()
{
    using boost::any;
    any x = 3;
    any y = 3.14f;
    any z = std::vector<int>(10, 42);
    z = x;
    z = std::string("Hello, World!");
}
```

...Retrieve Any Value

```
#include <boost/any.hpp>
#include <string>
#include <iostream>
using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

…Retrieve Any Value

```
#include <boost/any.hpp>
#include <string>
#include <iostream>
using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

s1 and s2: both "pumpkin"

…Retrieve Any Value

```
#include <boost/any.hpp>
#include <string>
#include <iostream>
using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

does s1 contain a string?

…Retrieve Any Value

```
#include <boost/any.hpp>
#include <string>
#include <iostream>
using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

pointer in, pointer out

...Retrieve Any Value

```
#include <boost/any.hpp>
#include <string>
#include <iostream>
using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

...Retrieve Any Value

```
#include <boost/any.hpp>

using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

…Retrieve Any Value

```
#include <boost/any.hpp>
#include <string>
#include <iostream>
using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

reference in, reference out; throws `bad_any_cast` on failure

...Retrieve Any Value

```
#include <boost/any.hpp>
#include <string>
#include <iostream>
using std::string; using boost::any; using boost::any_cast;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

. . . Retrieve Any Value

```
$ c++ -I /path/to/boost pumpkin.cpp -o test
$
```

```
#in
#in
#in
usi                                                    st;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

    if ( string* p = any_cast<string>(&s1) ) {
       p->replace(0, 4, "Rumplestilts");
    }
    std::cout << any_cast<string>(s1) << " turned into a "
      << any_cast<string>(s2) << std::endl;
}
```

boostpro computing

...Retrieve Any Value

```
$ c++ -I /path/to/boost pumpkin.cpp -o test
$ ./test
Rumplestiltskin turned into a pumpkin
$
```

```
#in
#in
#in
usi                                                    st;

int main()
{
    any s1 = string("pumpkin"),
        s2 = s1;

boostpro computing

Creating Value

```
{
     "first": "Dave",
     "last": "Abrahams",
     "age": 48.2,
     "sex": "M",
     "zip code": "02143",
     "registered": true,
     "catchphrase": null
     "interests": [
       "Jamming",
       "Biking",
       "Hacking"
    ]
}
```

Creating Value

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = string("Dave");
    me["last"] = string("Abrahams");
    me["age"] = 48.2;
    me["sex"] = string("M");
    me["zip code"] = string("02143");
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back(string("Jamming"));
    my_interests.push_back(string("Biking"));
    my_interests.push_back(string("Hacking"));
    me["interests"] = my_interests;
    return me;
}
```

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

boostpro computing

Highlights

- C++, STL, and much of Boost run on value semantics
- Boost.Any wraps values, exposing value semantics and erasing type information
- Just one of 100+ *header-only libraries* you can use without building or linking library binaries
- Find docs for library *xyzzy* at http://boost.org/libs/*xyzzy*
- Top-level headers: `#include <boost/`*xyzzy*`.hpp>`
- Your include path (`-I` *whatever*) should *contain a directory that contains a directory* named `boost/`

boostpro computing

Exercise

- http://github.com/boostpro/bbn-2012-11/tree/master/exercises/any-json
- Create json.hpp using Boost.Any for values (hint: slide 25)
- Use it to compile the *dave()* function supplied
- Write `operator<<(std::ostream&, json::value const&)` using a chain of `any_cast` tests to discover the stored type
- Don't worry about formatting, escaping quotes, or unicode
- Call your print function on the result of *dave()*
- BONUS: Find and fix the bug in *dave()*

The Bug

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = string("Dave");
    me["last"] = string("Abrahams");
    me["age"] = 48.2;
    me["sex"] = string("M");
    me["zip code"] = string("02143");
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back(string("Jamming"));
    my_interests.push_back(string("Biking"));
    my_interests.push_back(string("Hacking"));
    me["interests"] = my_interests;
    return me;
}
```

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

boostpro computing

The Bug

stores a `double`, not a `json::number` (a.k.a. `long double`)

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = string("Dave");
    me["last"] = string("Abrahams");
    me["age"] = 48.2;
    me["sex"] = string("M");
    me["zip code"] = string("02143");
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back(string("Jamming"));
    my_interests.push_back(string("Biking"));
    my_interests.push_back(string("Hacking"));
    me["interests"] = my_interests;
    return me;
}
```

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

boostpro computing

The Bug

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = string("Dave");
    me["last"] = string("Abrahams");
    me["age"] = 48.2;
    me["sex"] = string("M");
    me["zip code"] = string("02143");
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back(string("Jamming"));
    my_interests.push_back(string("Biking"));
    my_interests.push_back(string("Hacking"));
    me["interests"] = my_interests;
    return me;
}
```

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

boostpro computing

The Fix

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = string("Dave");
    me["last"] = string("Abrahams");
    me["age"] = number(48.2);
    me["sex"] = string("M");
    me["zip code"] = string("02143");
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back(string("Jamming"));
    my_interests.push_back(string("Biking"));
    my_interests.push_back(string("Hacking"));
    me["interests"] = my_interests;
    return me;
}
```

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

boostpro computing

The Fix

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = string("Dave");
    me["last"] = string("Abrahams");
    me["age"] = number(48.2);
    me["sex"] = string("M");
    me["zip code"] = string("02143");
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back(string("Jamming"));
    my_interests.push_back(string("Biking"));
    my_interests.push_back(string("Hacking"));
    me["interests"] = my_interests;
    return me;
}
```

OK

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

boostpro computing

The Fix

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = string("Dave");
    me["last"] = string("Abrahams");
    me["age"] = number(48.2);
    me["sex"] = string("M");
    me["zip code"] = string("02143");
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back(string("Jamming"));
    my_interests.push_back(string("Biking"));
    my_interests.push_back(string("Hacking"));
    me["interests"] = my_interests;
    return me;
}
```

OK

but casting is getting painful…

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

boostpro computing

What We Want

```
#include "json.hpp"

value dave()
{
    using namespace json;
    object me;
    me["first"] = "Dave";
    me["last"] = "Abrahams";
    me["age"] = 48.2;
    me["sex"] = "M";
    me["zip code"] = "02143";
    me["registered"] = true;
    me["catchphrase"] = null();
    array my_interests;
    my_interests.push_back("Jamming");
    my_interests.push_back("Biking");
    my_interests.push_back("Hacking");
    me["interests"] = my_interests;
    return me;
}
```

```
{
    "first": "Dave",
    "last": "Abrahams",
    "age": 48.2,
    "sex": "M",
    "zip code": "02143",
    "registered": true,
    "catchphrase": null
    "interests": [
      "Jamming",
      "Biking",
      "Hacking"
   ]
}
```

bool const xprime =                  x_t::value;
```

- Boost.EnableIf—Enabling/disabling templates

```
#include <boost/utility/enable_if.hpp>

enable_if<is_arithmetic<T>, U>::type
```

U if T is arithmetic, otherwise not a type

boostpro computing

Two Tools

- Boost.TypeTraits—Compile-Time Type Info (CTTI)

```
#include <boost/type_traits/is_arithmetic.hpp>

bool const x = is_arithmetic<Number>::value;
typedef        is_arithmetic<Number>::type x_t;
bool const xprime =                  x_t::value;
```

- Boost.EnableIf—Enabling/disabling templates

```
#include <boost/utility/enable_if.hpp>

enable_if<is_arithmetic<T> >::type
```

void if T is arithmetic, otherwise not a type

boostpro computing

Two Tools

- Boost.TypeTraits—Compile-Time Type Info (CTTI)

```
#include <boost/type_traits/is_arithmetic.hpp>

bool const x = is_arithmetic<Number>::value;
typedef        is_arithmetic<Number>::type x_t;
bool const xprime =                  x_t::value;
```

- Boost.EnableIf—Enabling/disabling templates

```
#include <boost/utility/enable_if.hpp>

enable_if<is_arithmetic<T> >::type
```

Aside: Dispatching with Traits

- Boolean-valued traits derive from true_type and false_type

```
template <class T>
struct is_pointer : false_type {};
template <class T>
struct is_pointer<T*> : true_type {};
```

- Use this fact to select overloads:

```
template <class T>
T f_impl(T x, true_type) { /* handle floating point */ }
template <class T>
T f_impl(T x, false_type) { /* handle other types */ }

T f(T x) { return f_impl(x, is_floating_point<T>()); }
```

Asserting Control

```
struct value
{
    value(object const& x)  : stored(x) {}
    value(array const& x)   : stored(x) {}
    value(string const& x)  : stored(x) {}
    template <class Number>
    value(Number const& x)  : stored(x) {}
    value(boolean const& x) : stored(x) {}
    value(null const& x)    : stored(x) {}

    friend std::ostream& operator<<(
        std::ostream& s, value const& x);
 private:
    boost::any stored;
};
```

boostpro computing

Asserting Control

```
struct value
{
    value(object const& x)  : stored(x) {}
    value(array const& x)   : stored(x) {}
    value(string const& x)  : stored(x) {}
    template <class Number>
    value(Number const& x)  : stored(x) {}
    value(boolean const& x) : stored(x) {}
    value(null const& x)    : stored(x) {}

    friend std::ostream& operator<<(
        std::ostream& s, value const& x);
 private:
    boost::any stored;
};
```

boostpro computing

Asserting Control

    template <class Number>
    value(Number const& x,
      typename boost::enable_if<
        boost::is_arithmetic<T> >::type* = 0)
                            : stored(x) {}
    value(boolean const& x) : stored(x) {}
    value(null const& x)    : stored(x) {}

    friend std::ostream& operator<<(
```

Compile It!

```
$ clang++ -I ~/src/boost-1.51 test.cpp -o tst && ./tst
```

boostpro computing

Compile It!

```
$ clang++ -I ~/src/boost-1.51 test.cpp -o tst && ./tst
{ "age": 48.2, "catchphrase": null, "first": true,
"interests": [ true, true, true ], "last": true,
"registered": true, "sex": true, "zip code": true }
$
```

boostpro computing

Exercise

- http://github.com/boostpro/bbn-2012-11/tree/master/exercises/wrapped-any-json
- Use the `is_convertible<T,U>` type trait to make a `json::value` constructor that catches types convertible to `json::string`
- Use it to fix the example so it yields:

```
{ "age": 48.2, "catchphrase": null, "first": "Dave", "interests":
[ "Reading", "Biking", "Hacking" ], "last": "Abrahams",
"registered": true, "sex": "M", "zip code": "02143" }
$
```

- BONUS: there solution file contains a way to get the desired result with NO_ENABLE_IF. What cases might this approach fail to handle?

Type Traits Foundations

```
struct true_type
{
    typedef true_type type;
    static bool const value = true;
};

struct false_type
{
    typedef false_type type;
    static bool const value = false;
};
```

Type Traits Foundations

```
struct true_type
{
    typedef true_type type;
    static bool const value = true;
};
```

T::type is just *T*

```
struct false_type
{
    typedef false_type type;
    static bool const value = false;
};
```

boostpro computing

Type Traits Foundations

```
struct true_type
{
    typedef true_type type;
    static bool const value = true;
};

struct false_type
{
    typedef false_type type;
    static bool const value = false;
};
```

T::value is the corresponding compile-time constant

boostpro computing

Type Traits Foundations

```
struct true_type
{
    typedef true_type type;
    static bool const value = true;
};

struct false_type
{
    typedef false_type type;
    static bool const value = false;
};
```

Container Printing

```
#include <ostream>

template <class Cont>
void print(std::ostream& os, Cont const& x)
{
    char const* prefix = "[ ";

    typedef typename Cont::const_iterator iter;
    for (iter p = x.begin(); p != x.end(); ++p)
    {
        os << prefix << *p;
        prefix = ", ";
    }
    os << " ]";
}
```

Container Printing

    BOOST_FOREACH( elt const& e, x )
    {
        os << prefix << e;
        prefix = ", ";
    }
    os << " ]";
}
```

Range Printing

```
#include <boost/foreach.hpp>
#include <boost/range.hpp>
#include <ostream>
template <class Cont>
void print(std::ostream& os, Cont const& x)
{
    char const* prefix = "[ ";

    typedef typename boost::range_value<Cont>::type elt;
    BOOST_FOREACH( elt const& e, x )
    {
        os << prefix << e;
        prefix = ", ";
    }
    os << " ]";
}
```

Range Printing

```
#include <boost/foreach.hpp>
#include <boost/range.hpp>
#include <ostream>
template <class Cont>
void print(std::ostream& os, Cont const& x)
{
    char const* prefix = "[ ";

    typedef typename boost::range_value<Cont>::type elt;
    BOOST_FOREACH( elt const& e, x )
    {
        os << prefix << e;
        prefix = ", ";
    }
    os << " ]";
}
```

Range Printing

```
#include <boost/foreach.hpp>
#include <boost/range.hpp>
#include <ostream>
template <class Cont>
void print(std::ostream& os, Cont const& x)
{
    char const* prefix = "[ ";

    typedef typename boost::range_value<Cont>::type elt;
    BOOST_FOREACH( elt const& e, x )
    {
        os << prefix << e;
        prefix = ", ";
    }
    os << " ]";
}
```

We'll come back to Boost.Range

Range Printing

```
#include <boost/foreach.hpp>
#include <boost/range.hpp>
#include <ostream>
template <class Cont>
void print(std::ostream& os, Cont const& x)
{
    char const* prefix = "[ ";

    typedef typename boost::range_value<Cont>::type elt;
    BOOST_FOREACH( elt const& e, x )
    {
        os << prefix << e;
        prefix = ", ";
    }
    os << " ]";
}
```

boostpro computing

Yes, We Can

```
int rng[3] = { 42, 314, 77 };
BOOST_FOREACH( int var, rng )
{
    . . .
}
```

Exercise

(this one's a "gimme")

- Use Boost.ForEach to re-implement JSON array and object printing

- Play around with it. Can you think of places to apply it in your work?
